

MURISPHERE TRAINING

Mobile Scan Tutorial (Printed Cage Card)

Professional phone-first workflow with vectorized screenshots for crisp print and PDF output.

Goal

Use a phone camera to scan a printed cage card and open the correct Murisphere cage record safely and quickly.

Sign in with technician credentials before running room updates.

Screenshot 2 - Generate and Print Cage Cards

Confirm each card shows a visible QR block and print at 100% scale.

Screenshot 3 - Scan/Edit Workflow

Phone camera opens the scan URL, then technician validates cage ID before saving edits.

Step-by-Step: Phone Scan of Printed Card

1. In **Cages**, set **Scan Base URL** to a phone-reachable host (LAN IP or production domain).
2. Click **Generate + Print** and verify the printed card contains a solid QR square.
3. Open the phone camera and point it at the printed QR code.
4. Tap the detected link banner to open cage info in browser.
5. Tap **Open Murisphere (login for edits)**, verify cage ID, then save updates.

Troubleshooting

- **No scan prompt:** improve lighting and flatten the printed card.
- **Wrong page opens:** correct `Scan Base URL` (never use localhost for printed cards).
- **Broken/blank QR:** verify server endpoint `/api/assets/qrcode.png?v=test` loads.
- **Slow open:** retest on stronger room Wi-Fi.
